

Identify the Database Listening Port

In the configuration file mentioned above find the tag that lists the port for the embedded MySQL database server. By default the MySQL database instance installed together with Agiloft is listening for connections on port **3333**.

```
<databasePort>3333</databasePort>
```

Verify External Connectivity to the Port

To be able to connect to Agiloft database from an external program the port has to be reachable. One of the ways to verify this is to attempt connecting via telnet:

```
telnet {your_ew_host} {port}
```

You can use Ctrl+] and Q to close the session.

```
host:~ youruser$ telnet 192.168.0.100 3333
Trying 192.168.0.100...
^C
host:~ youruser$
```

If the access to this port is denied by a firewall there will be no response. Press Ctrl+C to stop telnet.
