

Single Sign-on

Single Sign-On (SSO) is a secure access method that allows users to use one login for many applications. With so many applications in use, remembering and storing passwords can be burdensome for users and compromise security. Single sign-on methods share a common goal of simplifying user access by authenticating against a single identity source, which in turn communicates with other applications to grant access.

Agiloft integrates with several SSO methods, listed here:

- [Google OAuth 2.0 SSO](#)
- [SAML 2.0 SSO](#)
- [Windows SSO](#)
- [Single Sign-on with CAS](#)
- [SPNEGO Kerberos Authentication](#)
